

NetOp® Remote Control

Secure remote control software for large networks

In an ideal world, organisations would have uniform hardware and software across their entire network. However, in reality this is seldom the case. Most large networks are a patchwork of PCs and platforms.

NetOp is the secure remote control program designed specifically to complement large, diverse networks. How? Well for one thing NetOp supports an unprecedented range of platforms, granting you access to more than 20 different operating systems. NetOp is also the only remote control software on the market offering truly centralised security. That means you can not only control authentication, but also authorisation – all from one central location. Finally, NetOp enables you to effortlessly install pre-configured modules throughout your entire enterprise while also interfacing seamlessly with all commonly used management console and help desk systems. This makes NetOp easy to integrate into your existing environment.

For fast remote control software as broad and varied as your network, try NetOp Remote Control.

REAL SECURE

NetOp offers a wide range of variable security features. Security barriers include multiple passwords, IP address checks, closed user-groups, authentication, call-back, user-controlled access, and authorisation. Virtually all options can be centrally controlled. In addition, automated timeouts and 256-bit encryption provide intrusion protection, while session recording and event logging help detect intrusion attempts.

REAL CROSS-PLATFORM

Designed to complement large, complex networks, NetOp supports all commonly used platforms – that means all Windows systems (including Windows Server 2003), ActiveX, Mac OS X, Linux, Solaris and even Symbian OS and CE based handhelds. The NetOp Gateway securely routes NetOp traffic between different protocols. Among other things, this allows communication with Terminal Services sessions, and solves firewall connectivity issues.
